ACKNOWLEDGEMENT

We thank the almighty for giving us the courage and perseverance in completing the main project. This project itself is acknowledgement for all those people who give us their heartfelt co-operation in making this project a grand success.

We are thankful to our principal **Mr. G. Govinda Naidu** for providing the necessary infrastructure and labs and also permitting to carry out this project. With extreme jubilance and deepest gratitude, we would like to thank Head of the computer science Department, **Mr. G. Narasimha Murthy** for his constant encouragement.

Our special thanks to our project coordinator **Mr. G.Santosh** for providing valuable guidance at every stage of this project work. We are profoundly grateful towards the unmatched services rendered by her.

Our special thanks to all the faculty of Computer Science Department and peers for their valuable advices at every stage of this work.

Last but not least, we would like to express our deep sense of gratitude and earnest thanks giving to our parents for their moral support and heartfelt cooperation in doing the main project.

The project on **EMPLOYEE DATABASE MANAGEMENT SYSTEM** was very helpful to me in giving the necessary background information and inspiration in choosing this topic. Our sincere thanks to all of our friends for having supported the work related to this project.

ABSTRACT

The **"EMPLOYEE DATABASE MANAGEMENT SYSTEM"(EDMS)** is designed to streamline the management of employee information within organizations. This system facilitates the efficient storage, retrieval and manipulation of employee data, including personal details, employment history and performance evaluations. By employing a user-friendly interface, the EDMS enhances the accessibility for HR personnel and management, enabling them to make informs decisions based on accurate and up-to-date information.

The system utilizes a relational database model, ensuring data integrity and consistency while allowing for easy scalability as organizational needs evolve. Key features include automated reporting, role-based access control and data analytics capabilities which assist in workforce planning and optimization. Through this comprehensive solution, organizations can improve organization efficiency, reduce administrative workload and enhance employee satisfaction by fostering a more organized and responsive work environment.

The EDMS incorporates features as automated attendance, leave management and comprehensive reporting capabilities enabling HR departments to make informed decisions based on real time data analysis. Security measures are implemented to protect sensitive information ensuring compliance with legal standards and organizational policies.By offering an intuitive user interface and self service capabilities, the EDMS enhances employee management and accountability while reducing administrative burdens on HR staff. The integration of the system with existing business processes seamless workflows and optimizes resource allocation. Ultimately, the EDMS serves as a vital tool for improving operational efficiency, enhancing employee satisfaction and supporting organizational growth.

CONTENTS

Chapters Description

1. **INTRODUCTION**
   1.1 Project Overview
   1.2 Project Objectives
2. **FEASIBILITY STUDY**
   2.1Technical feasibility
   2.2 Operational feasibility
3. **REQUIREMENT ANALYSIS AND SPECIFICATION**
   3.1 Admin Panel
   3.2 User Panel
4. **SYSTEM REQUIREMENTS**
   4.1. Hardware requirements
   4.2. Software requirements
5. **Technology Used in this Project**
6. **SYSTEM DESIGN**
   6.1. Introduction
   6.2. ER diagrams
   6.3. UML Diagrams
7. **IMPLEMENTATION**
   7.1. Sample code
8. **TESTING &VALIDATION**
9. **SCREEN SHOTS**
10. **CONCLUSION**

1.Introduction

1.1 PROJECT OVERVIEW: -

An employee database management system(EDMS) is a comprehensive software application that focuses on the efficient management of employee data within an organization. It serves as a centralized repository, facilitating the retrieval of essential employee information.

It is a specialized software application designed to handle all aspects of employee data management within an organization. It provides a platform for storing, organizing and retrieving employee information , thereby streamlining human resource processes. By integrating various HR functions into one platform, EDMS streamlines human resource processes and enhances overall organization efficiency.

1.2 PROJECT OBJECTIVES: –

- Create a single repository for all employee information, ensuring easy access and management.
- Implement validation rules and regular updates to maintain accurate and reliable employee records.
- Enable authorized personnel to access employee data from any location, supporting remote work and flexibility.
- Streamline HR processes such as recruitment, on-boarding and performance evaluations, reducing manual workload.
- Protect sensitive employee information through role-based access controls, secure authentication methods.
- Generate real-time reports on employee metrics, attendance and performance to facilitate data- driven decision making.

- Design an intuitive and responsive user interface to enhance user experience and minimize training time.
- Support integration with other business systems for seamless dataflow and improved operational efficiency.
- Ensure the system can grow with the organization, accommodating an increasing number of employees and reduce data complexity.

2.FEASIBILITY STUDY

2.1 TECHNICAL FEASIBILITY: -

The technical feasibility in the proposed system deals with the technology used in the system. It deals with the hardware and software used in the system whether they are of latest technology or not. It happens that after a system is prepared a new technology arises and the user wants the system based on that technology. This system uses windows platform, HTML,CSS and JavaScript as front-end technology and MySql as backend technology. Thus "**EMPLOYEE DATABASE MANAGEMENT SYSTEM"** is technically feasible.

2.2 OPERATIONAL FEASIBILITY: -

The project has been developed in such a way that it becomes very easy even for a person with little computer knowledge to operate it. This software is very user friendly and does not require any technical person to operate. Thus, the project is even operationally feasible.

3. REQUIREMENT ANALYSIS AND SPECIFICATION

3.1Admin Panel:

* Different Login system for Admin and Employees.

* Admin can add new employees, Assign individual Projects, Check Salary, Check Status of projects, Mark the projects.

* Leaderboard gets updated upon providing the marks.

* According to the marks employees get bonus over the base salary.

3.2 User Panel:

* Check the leaderboard, Due projects and salary.

* Can view own profile and update the basic infos.

* Submit the project.

* Apply for leave.

4. SYSTEM DESIGN

4.1 HARDWARE REQUIREMENTS

The section of hardware configuration is an important task related to the software development insufficient random-access memory may affect adversely on the speed and efficiency of the entire system. The process should be powerful to handle the entire operations. The hard disk should have sufficient capacity to store the file and application.

Processor	:12th Gen Intel(R) Core (TM) i5-1235U
Processor speed	: 1.30 GHz Onwards
System memory	: 64-bit operating system, x64-based processor
RAM	: 16 GB (Minimum)
Hard disk	: 512 GB
Monitor	: SVGA Color 15”
Mouse	: 104 keys US Key Serial, USB or PS/2

4.2 SOFTWARE REQUIREMENTS

A major element in building a system is the section of compatible software since the software in the market is experiencing in geometric progression. Selected software should be acceptable by the firm and one user as well as it should be feasible for the system.

This document gives a detailed description of the software requirement specification. The study of requirement specification is focused specially on the functioning of the system. It allow the developer or analyst to understand the system, function to be carried out the performance level to be obtained and corresponding interfaces to be established.

Front end tool : HTML,CSS,JAVASCRIPT

Backend : SQL,PHP

Operating system : Windows11

5. TECHNOLOGY USED IN THIS PROJECT

Web Technology

Web Technology refers to the various tools and techniques that are utilized in the process of communication between different types of devices over the Internet. A web browser is used to access web pages. Web browsers can be defined as programs that display text, data, pictures, animation, and video on the Internet. Hyperlinked resources on the World Wide Web can be accessed using software interfaces provided by Web browsers. It consists of both frontend and backend technologies and some of them are used:

- HTML
- CSS
- Javascript
- PHP

- MYSQL

1. **HTML:** HTML (HyperText Markup Language) is the foundational language used for creating and structuring content on the web. It consists of a series of elements, or tags, that define various types of content, such as headings, paragraphs, links, images, and more. Each HTML document starts with a <!DOCTYPE html> declaration, followed by <html>, <head>, and <body> sections, which organize the content and metadata. HTML also employs attributes to provide additional information about elements, enhancing their functionality and appearance. Browsers interpret HTML to render webpages, allowing users to view and interact with online content effectively.

   Steps to execute html:

   - Create a file.
   - Write html code
   - Save the code
   - Open browser and view output.

2. **CSS:**

CSS (Cascading Style Sheets) is a stylesheet language used to control the appearance of HTML documents. It separates content from design, allowing for flexible styling of elements such as colors, fonts, and layouts. CSS can be applied inline, within <style> tags, or via external stylesheets. It supports responsive design through media queries, enabling websites to adapt to different screen sizes. Overall, CSS enhances visual aesthetics and user experience across web pages.

3. **JAVASCRIPT:**

JavaScript is a powerful, dynamic programming language that enables interactive and responsive web applications by allowing developers to manipulate HTML and CSS, handle events, and perform asynchronous operations. jQuery, a lightweight JavaScript library, simplifies the process of DOM manipulation, event handling, and AJAX requests, making it easier to write concise and maintainable code. Together, JavaScript and jQuery enhance user experiences by enabling rich, interactive features on websites.

4. **PHP:**

   PHP (Hypertext Protocol) is Open Source Programming Language used to make web pages. PHP language can run on various platforms and is compatible with almost all servers. PHP files use .php as their extension. PHP can perform functions, like from files on a system it can create, open, read, write, and close them. You can add, delete, and modify elements within your database with the help of PHP. You can restrict users from accessing some pages of your website using PHP. PHP can encrypt data too.

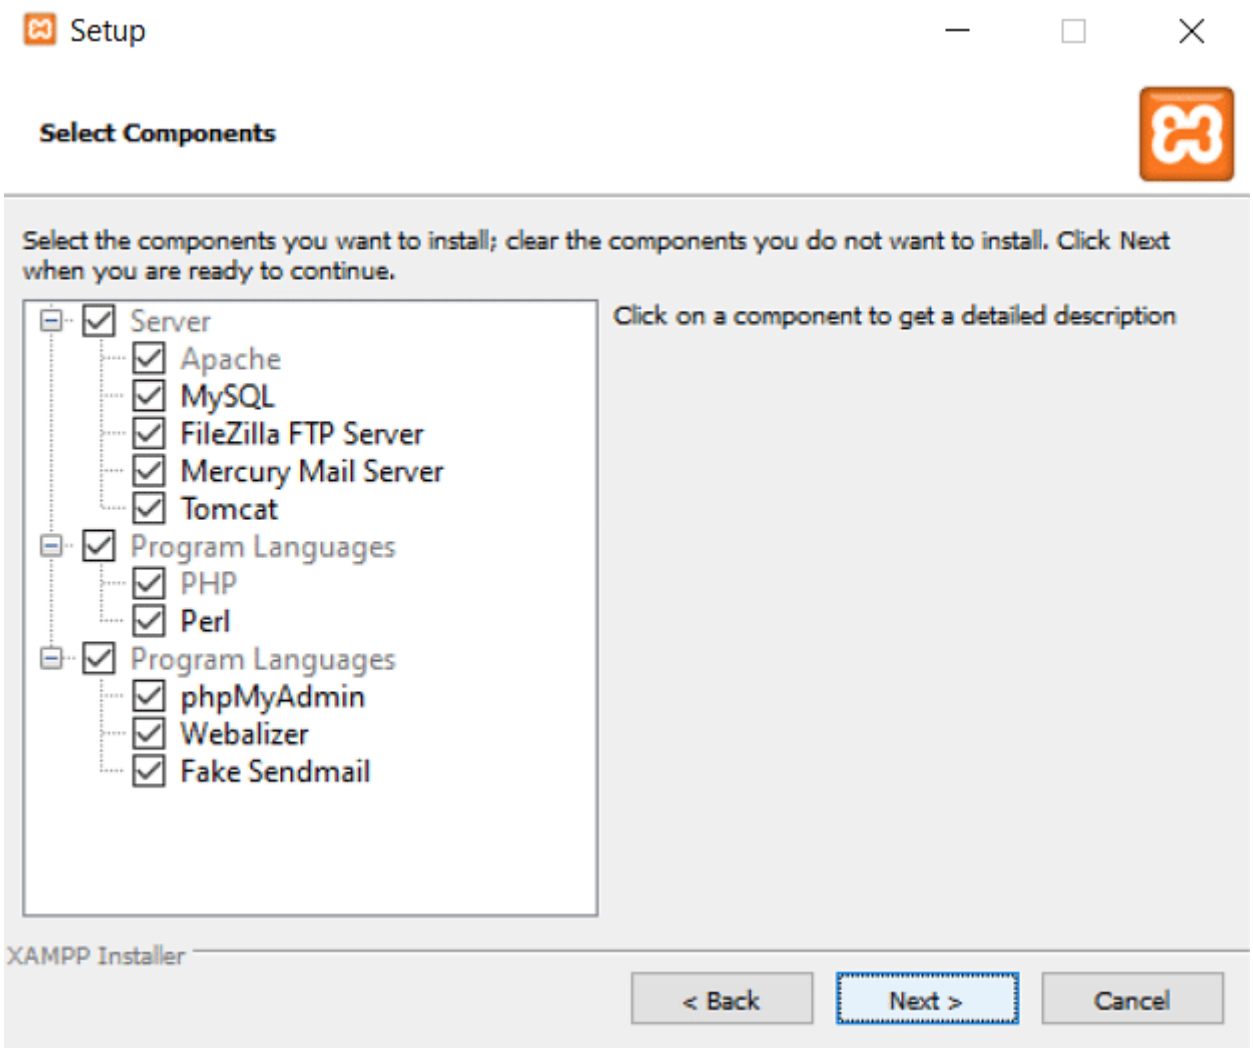
STEPS TO EXECUTE XAMPP:

How to Install XAMPP?

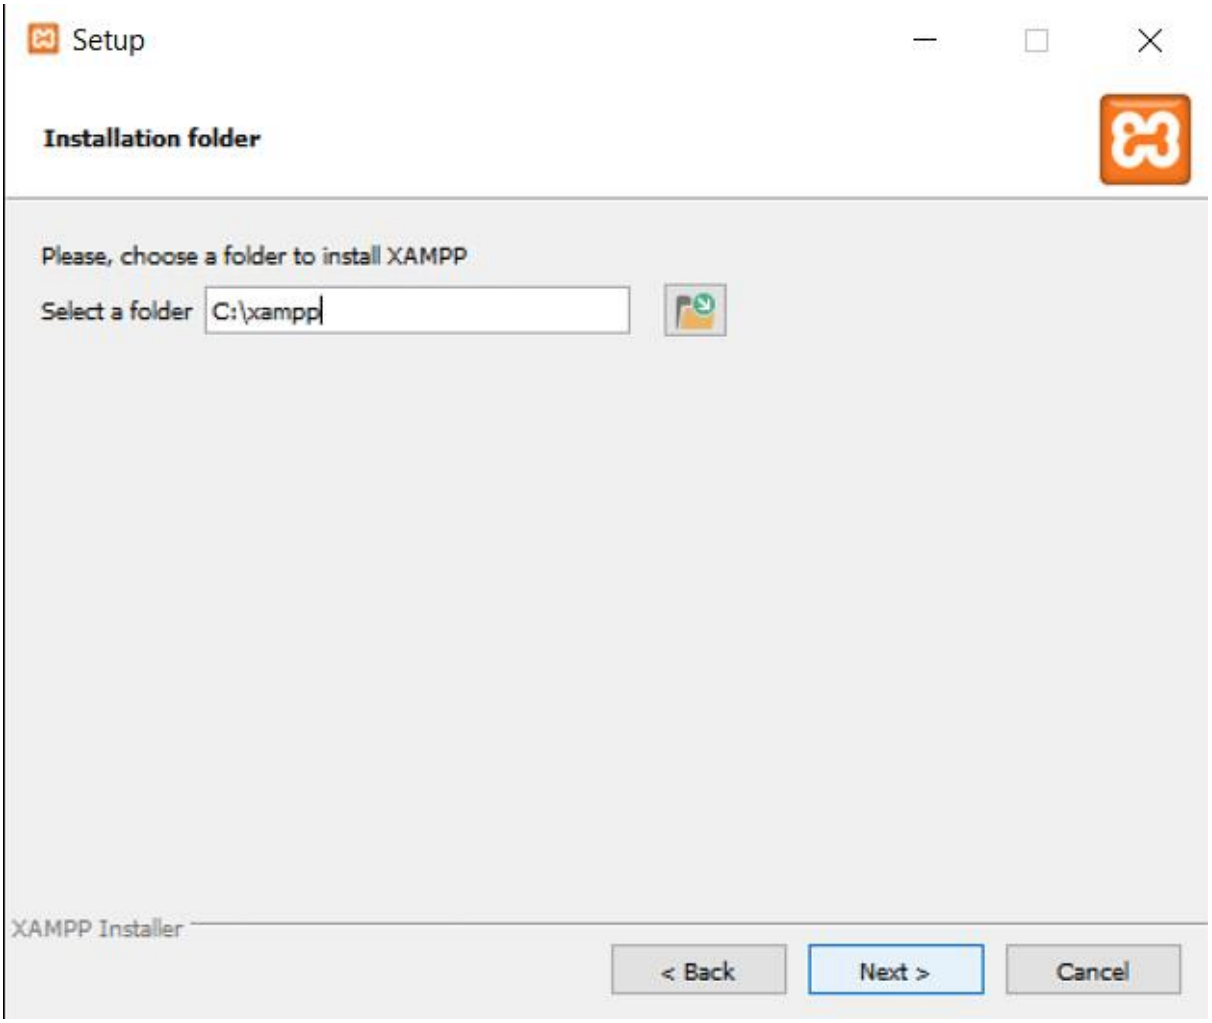
Apache friends developed XAMPP, and it is available for everyone free of cost.

You can download XAMPP through the official website, https://www.apachefriends.org/download.html.

On completing the download of the setup file, begin the installation process and, in the “Select Components” section, select all the required components.



Next, select the directory where you want the software to be installed. It is recommended that you keep the default directory “C:\xampp” and click on “next” to complete the installation.



Now that the installation is complete, let’s move ahead to see how to run a PHP script using the same.

How to Start a New PHP Project in XAMPP?

- Before you run or start writing any program in PHP, you should start Apache and MYSQL.
- After starting both servers, you have to write a program in Notepad.
- After writing it, save that file as "program.php".
- Then copy that file program.php to C:/Program Files/XAMPP/htdocs.

- Open the browser and type http://localhost.
- Now run your code in that browser.

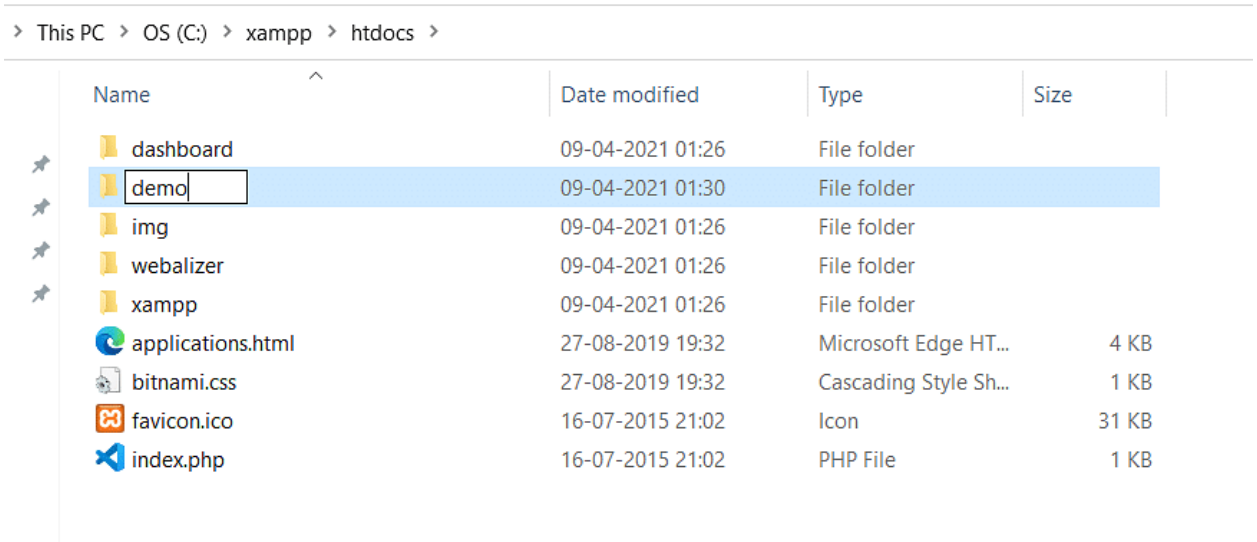
How to Run a PHP Code Using XAMPP?

Before running a PHP script, you must know where to write it.

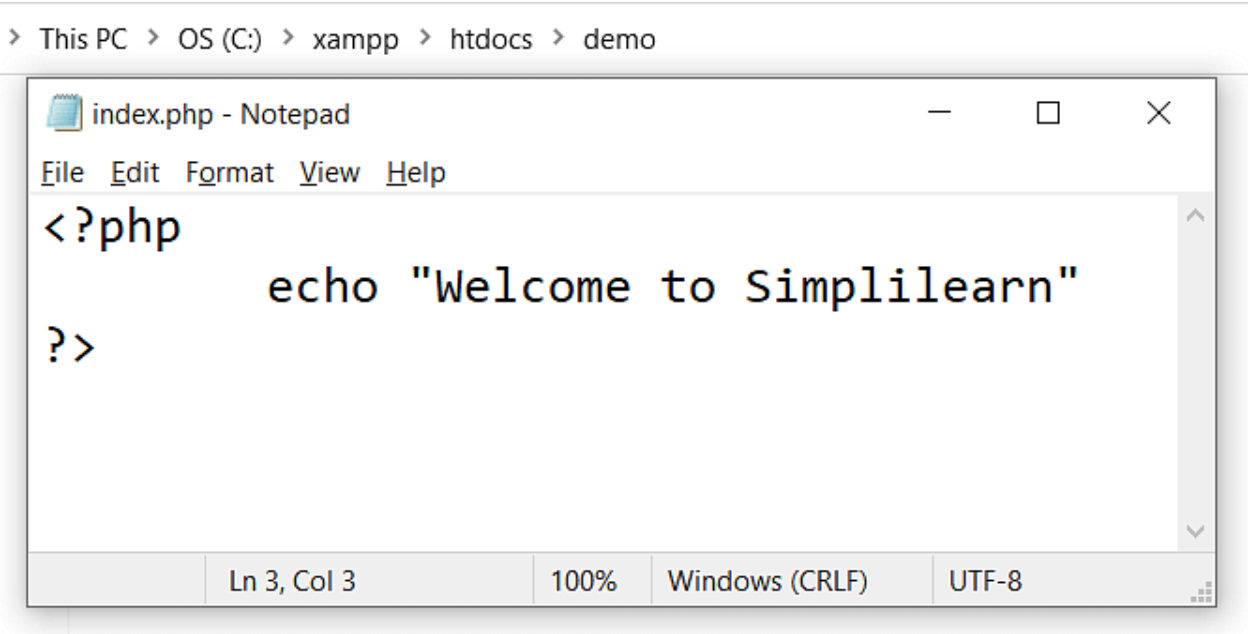
In the XAMPP directory, there exists a folder called “htdocs”. This is where all the programs for the web pages will be stored.

Now, to run a PHP script:

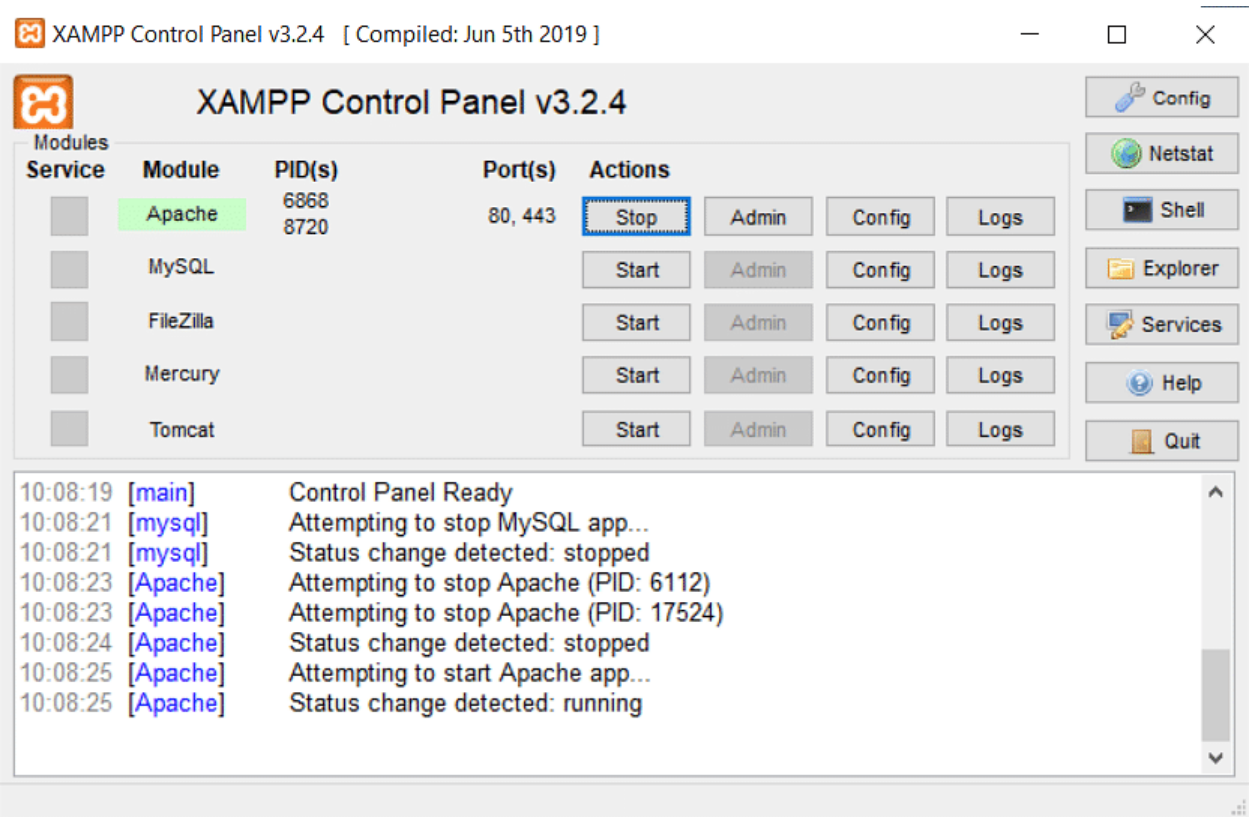
1. Go to “C:\xampp\htdocs” and inside it, create a folder. Let’s call it “demo”. It’s considered good practice to create a new folder for every project you work on.



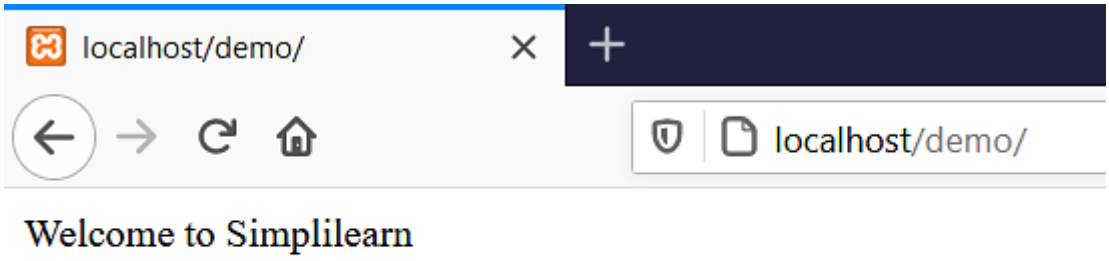
2. Inside the demo folder, create a new text file and name it “index.php” and write the following script.



3. Now, to see the script output, open the XAMPP control panel and start Apache to host the local webserver, where our script will be running.



4. Now navigate to your browser and type in “localhost/demo/” in the address bar to view the output.



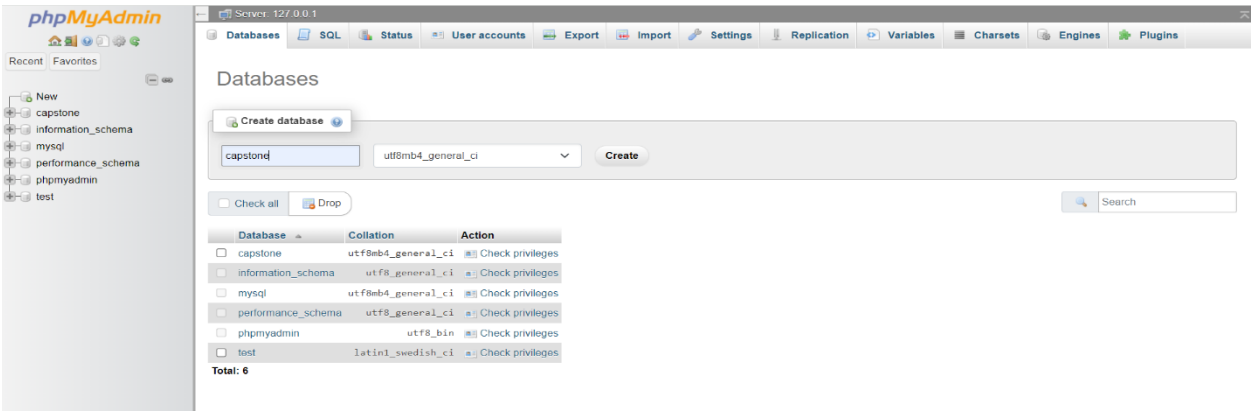
5. **MYSQL:**

Connecting to MySQL using PHP is an essential web development task that enables access to a website database. It provides a way to communicate with the database and forward information to the front-end.

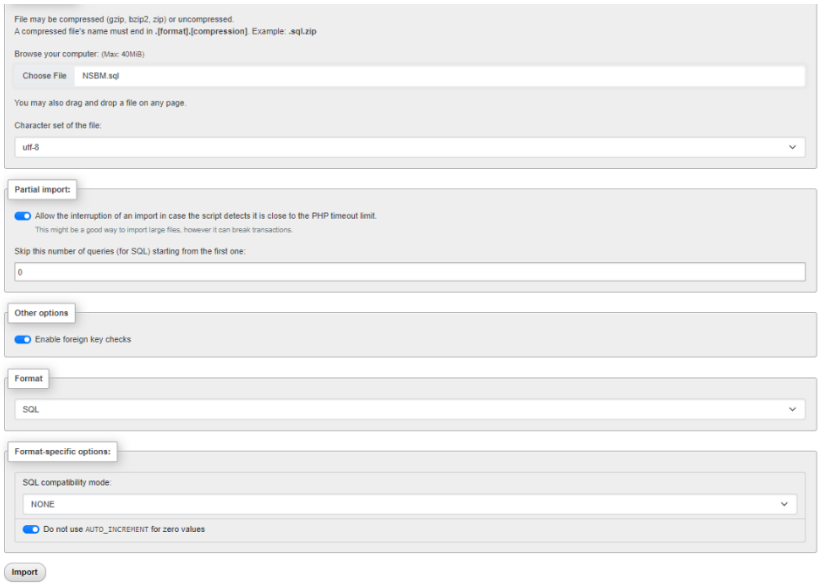
As a server-side scripting language, PHP has different ways to connect and interact with MySQL databases.

STEPS TO EXECUTE MYSQL:

1. Creation of database



2.Importing of database



3.Connect to database

dbcon.php

File Edit View

```php
<?php
$servername = "localhost:3306";
$username = "root";
$password = "";
$dbname = "capstone";

// Create connection
$conn = new mysqli($servername, $username, $password,$dbname);

// Check connection
if ($conn->connect_error) {
    die("Connection failed: " . $conn->connect_error);
}
//echo "Connected successfully";
?>
```

4.Connects successfully and perform all operations.

6. SOFTWARE DESIGN

6.1ER DIAGRAM

An Entity Relationship Diagram is a diagram that represents relationships among entities in a database. It is commonly known as an ER Diagram. An ER Diagram in DBMS plays a crucial role in designing the database. Today's business world previews all the requirements demanded by the users in the form of an ER Diagram. Later, it's forwarded to the database administrators to design the database.

An Entity Relationship Diagram (ER Diagram) pictorially explains the relationship between entities to be stored in a database. Fundamentally, the ER Diagram is a structural design of the database. It acts as a framework created with specialized symbols for the purpose of defining the relationship between the database entities. ER diagram is created based on three principal components: entities, attributes, and relationship

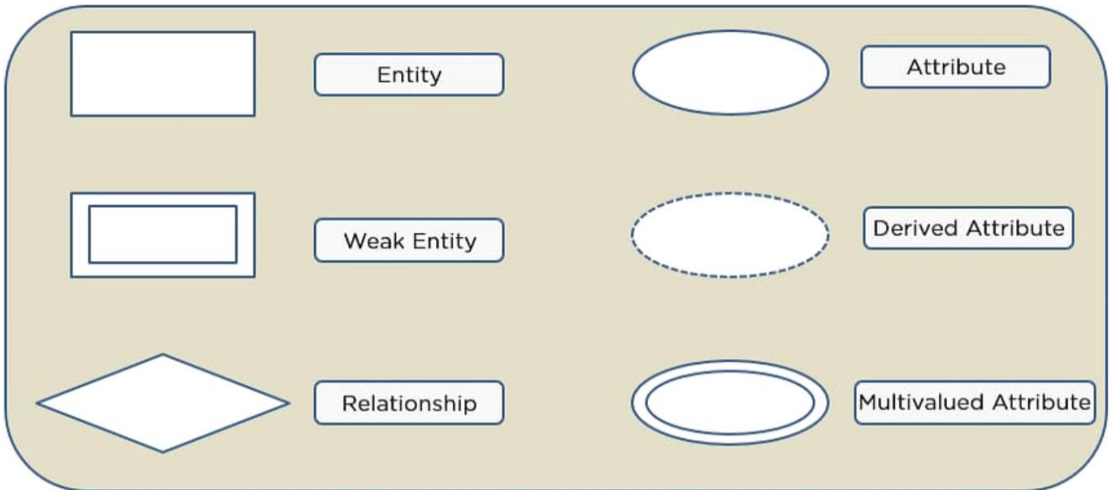
Uses of ER diagrams:

- ER Diagram helps you conceptualize the database and let's you know which fields need to be embedded for a particular entity.
- ER Diagram gives a better understanding of the information to be stored in a database.
- It reduces complexity and allows database designers to build databases quickly.
- It helps to describe elements using Entity-Relationship models.
- It allows users to get a preview of the logical structure of the database.

Symbols Used in ER Diagrams

- Rectangles: This Entity Relationship Diagram symbol represents entity types.

- Ellipses: This symbol represents attributes
- Diamonds: This symbol represents relationship types
- Lines: It links attributes to entity types and entity types with other relationship types.
- Primary key: Here, it underlines the attributes
- Double Ellipses: Represents multi-valued attributes.



Components of ER Diagram

You base an ER Diagram on three basic concepts:

Entities

- Weak Entity

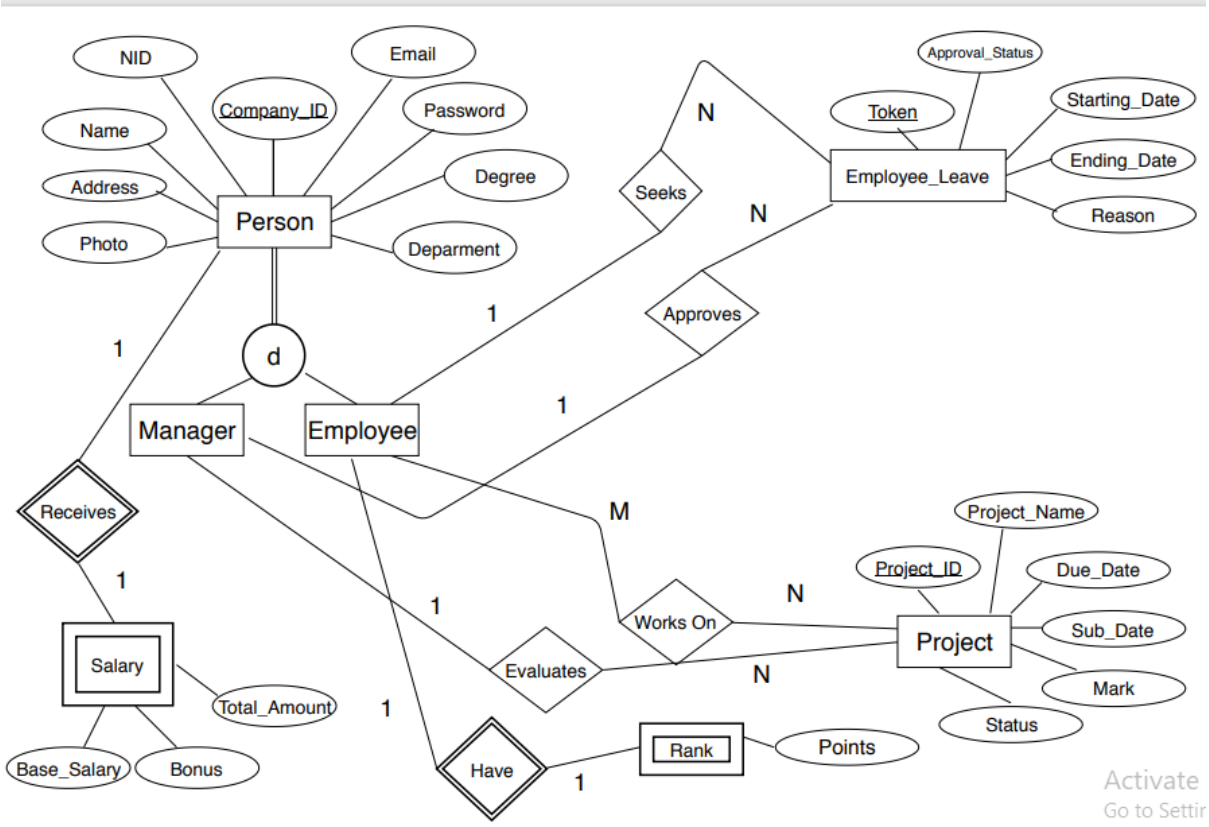
Attributes

- Key Attribute

- Composite Attribute
- Multi valued Attribute
- Derived Attribute

Relationships

- One-to-One Relationships
- One-to-Many Relationships
- Many-to-One Relationships
- Many-to-Many Relationship

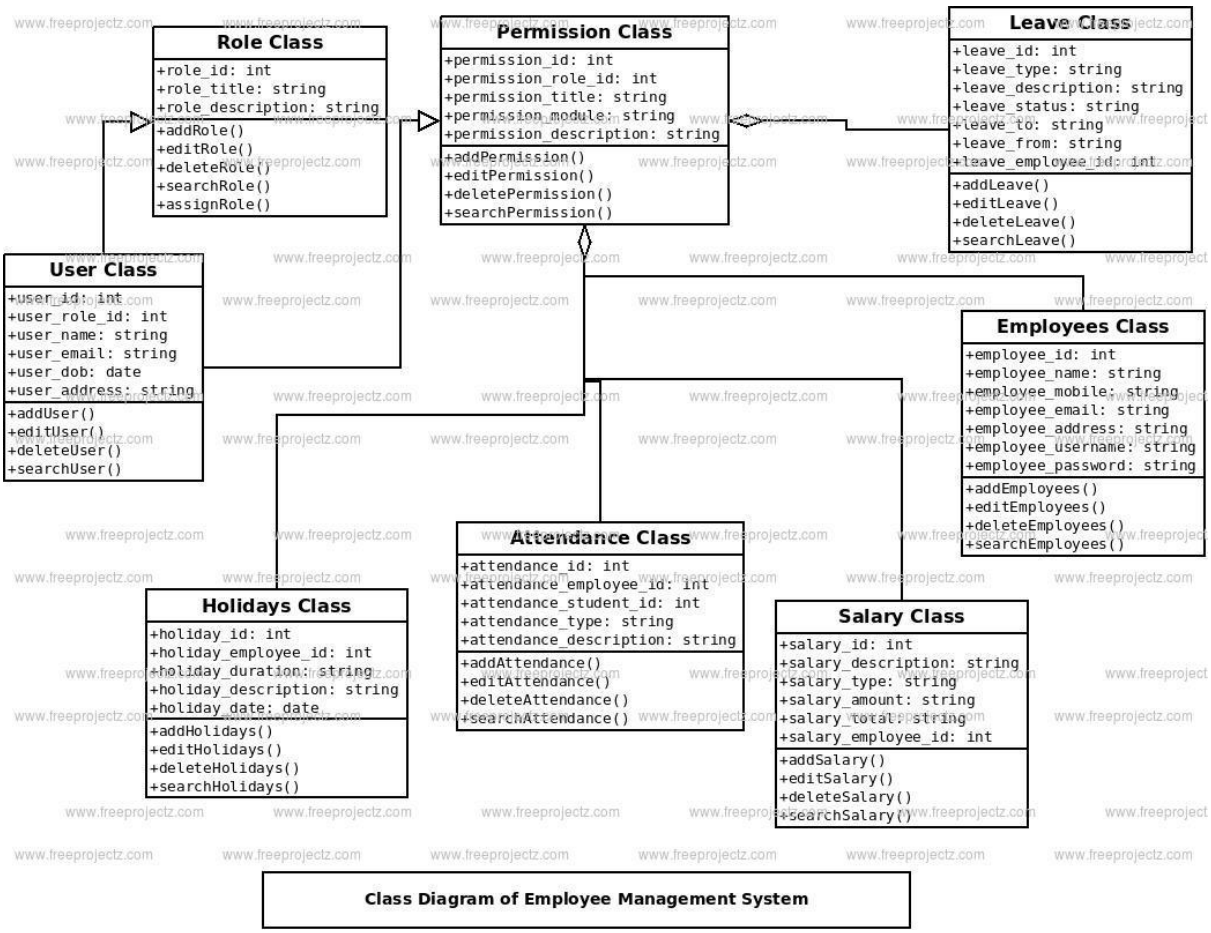


6.2 UML DIAGRAMS

CLASS DIAGRAM:

In software engineering, a class diagram in the Unified Modeling Language (UML) is a type of static structure diagram that describes the structure of a system by showing the system's classes, their attributes, operations (or

methods), and the relationships among the classes. It explains which class contains information.



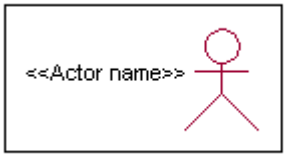
Class Diagram of Employee Management System

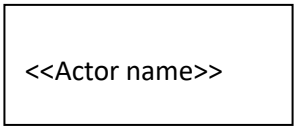
USE CASE DIAGRAM:

1. Global Use Case Diagrams:
2. Identification of actors:

Actor: Actor represents the role a user plays with respect to the system. An actor interacts with, but has no control over the use cases.

Graphical representation:





An actor is someone or something that:

Interacts with or uses the system.

- Provides input to and receives information from the system.
- Is external to the system and has no control over the use cases.

Actors are discovered by examining:

- Who directly uses the system?
- Who is responsible for maintaining the system?
- External hardware used by the system.
- Other systems that need to interact with the system.

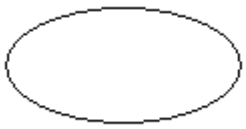
The actors identified in this system are:

a. System Administrator
b. Customer
c. Customer Care

Identification of usecases:

Usecase: A use case can be described as a specific way of using the system from a user's (actor's) perspective.

Graphical representation:



A more detailed description might characterize a use case as:

- Pattern of behaviour the system exhibits
- A sequence of related transactions performed by an actor and the system
- Delivering something of value to the actor

Use cases provide a means to:

- capture system requirements
- communicate with the end users and domain experts
- test the system

Use cases are best discovered by examining the actors and defining what the actor will be able to do with the system.

Guide lines for identifying use cases:

- For each actor, find the tasks and functions that the actor should be able to perform or that the system needs the actor to perform. The use case should represent a course of events that leads to clear goal
- Name the use cases.
- Describe the use cases briefly by applying terms with which the user is familiar.

This makes the description less ambiguous

Flow of Events

A flow of events is a sequence of transactions (or events) performed by the system. They typically contain very detailed information, written in terms of what the system should do, not how the system accomplishes the task. Flow of events are created as separate files or documents in your favourite text editor and then attached or linked to a use case using the Files tab of a model element.

A flow of events should include:

- When and how the use case starts and ends
- Use case/actor interactions

- Data needed by the use case
- Normal sequence of events for the use case
- Alternate or exceptional flow

A use case diagram in the Unified Modelling Language (UML) is a type of behavioural diagram defined by and created from a Use-case analysis. Its purpose is to present a graphical overview of the functionality provided by a system in terms of actors, their goals (represented as use cases), and any dependencies between those use cases. The main purpose of a use case diagram is to show what system functions are performed for which actor. Roles of the actors in the system can be depicted.

8.TESTING &VALIDATION

SYSTEM TESTING

The purpose of testing is to discover errors. Testing is the process of trying to discover every conceivable fault or weakness in a work product. It provides a way to check the functionality of components, sub-assemblies, assemblies and/or a finished product It is the process of exercising software with the intent of ensuring that the

Software system meets its requirements and user expectations and does not fail in an unacceptable manner. There are various types of tests. Each test type addresses a specific testing requirement.

TYPES OF TESTS

Unit testing

Unit testing involves the design of test cases that validate that the internal program logic is functioning properly, and that program inputs produce valid outputs. All decision branches and internal code flow should be validated. It is the testing of individual software units of the application .it is done after the completion of an individual unit before integration. This is a structural testing, that relies on knowledge of its construction and is invasive. Unit tests perform basic tests at component level and test a specific business process, application, and/or system configuration. Unit tests ensure that each unique path of a business process performs accurately to the documented specifications and contains clearly defined inputs and expected results

Integration testing

Integration tests are designed to test integrated software components to determine if they actually run as one program. Testing is event driven and is more concerned with the basic outcome of screens or fields. Integration tests demonstrate that although the components were individually satisfaction, as shown by successfully unit testing, the combination of components is correct

and consistent. Integration testing is specifically aimed at exposing the problems that arise from the combination of component.

Functional test

Functional tests provide systematic demonstrations that functions tested are available as specified by the business and technical requirements, system documentation, and user manuals.

Functional testing is centered on the following items:

Valid Input : identified classes of valid input must be accepted.

Invalid Input : identified classes of invalid input must be rejected.

Functions : identified functions must be exercised.

Output : identified classes of application outputs must be exercised.

Systems/Procedures: interfacing systems or procedures must be invoked.

Organization and preparation of functional tests is focused on requirements, key functions, or special test cases. In addition, systematic coverage pertaining to identify Business process flows; data fields, predefined processes, and successive processes must be considered for testing. Before functional testing is complete, additional tests are identified and the effective value of current tests is determined.

System Test

System testing ensures that the entire integrated software system meets requirements. It tests a configuration to ensure known and predictable results. An example of system testing is the configuration-oriented system integration test. System testing is based on process descriptions and flows, emphasizing pre-driven process links and integration points.

10.Conclusion

To conclude the description about the project. The project, developed using HTML,CSS,JAVASCRIPT Community and MYSQL,PHP is based on the requirement specification of the user and the analysis of the existing system, with flexibility for future enhancement.

EMPLOYEE DATABASE MANAGEMENT SYSTEM(EDMS) represents a strategic investment for organizations aiming to optimize their human resource management. By automating key processes such as recruitment, onboarding, performance evolution, an EDMS significantly reduces administrative burdens, allowing HR professionals to focus on strategic initiatives that drive employee arrangement and organization growth.

Moreover, an EDMS enhances data security and confidentially by providing controlled access to sensitive employee information, ensuring compliance with data protection regulations. The ability to generate comprehensive reports and analytics empowers decision-makers to identify trends, access workforce performance, make informed strategic decisions. It can adopt to changing organizational needs, supporting scalability and integration with other systems. This flexibility is vital in a rapidly changing business environment.

In conclusion, an Employee database management system(EDMS) is not just a tool for managing data. It is a cornerstone of effective human resource management that fosters a productive workplaces, enhances communication and ultimately contributes to a company's success. By investing in an EDMS, organizations can build a more organized, efficient, responsive workforce positioning themselves competitively in the marketplace.
